

Project Root

manage.py — CLI entry point. Run commands like runserver, migrate, makemigrations
. Sets DJANGO_SETTINGS_MODULE to point to your settings file.

Inner Project Package: backend_intern_certificate/

settings.py — Master config file. Defines:

SECRET_KEY (keep secret in production)

DEBUG = True (turn off in production)

INSTALLED_APPS — registers Django built-ins + your app1

DATABASES — uses SQLite (db.sqlite3)

MIDDLEWARE — security, sessions, CSRF, auth layers

TEMPLATES — tells Django to look for templates inside app folders (APP_DIRS: True)

STATIC_URL — serves static files from /static/

urls.py — Root URL router. Two routes:

/admin/ → Django admin panel

/certificates/ → delegates all further routing to app1/urls.py

wsgi.py — Entry point for traditional WSGI servers (e.g. Gunicorn, Apache). Used in production deployment.

asgi.py — Entry point for async ASGI servers (e.g. Daphne, Uvicorn). Used when you need async/WebSocket support.

__init__.py — Marks this folder as a Python package. Empty, but required.

App: app1/

models.py — Defines the Certificate database table with fields:

name (text, max 100)

email (validated email field)

course (text, max 100)

issue_date (auto-set to today on creation)

__str__ returns "name - course" for readable display

forms.py — Defines CertificateForm as a ModelForm tied to Certificate. Exposes only name, email, course fields (not issue_date, since it's auto-set).

views.py — Two view functions:

certificate_list — fetches all certificates from DB, renders the list template

certificate_create — handles GET (show empty form) and POST (validate + save form, then redirect to list)

urls.py — App-level URL routing:

certificates/ → certificate_list view

certificates/create/ → certificate_create view

admin.py — Registers models with Django admin. Currently empty (no models registered, so Certificate won't appear in /admin/ panel).

apps.py — App config class App1Config. Tells Django the app name is app1. Used internally by Django when loading the app.

tests.py — Placeholder for unit tests. Currently empty.

migrations/__init__.py — Marks migrations folder as a package. Django stores auto-generated migration files here after running makemigrations.

Templates: app1/templates/app1/

base.html — Base layout with basic HTML structure. Has a {% block content %} placeholder that child templates fill in.

certificate_list.html — Extends base.html. Shows all certificates in a list with name, course, and issue date. Has a link to the create page.

certificate_form.html — Extends base.html. Shows the add-certificate form with CSRF token, renders fields as tags, has a Save button and a Back link.

Database

db.sqlite3 — The actual SQLite database file. Auto-created when you run migrate. Stores all your Certificate records locally.
